Abstract:
Agenda Power in Brazil's Câmara dos Deputados, 1989 to 1998

This paper examines a general proposition about democratic legislatures—that their agenda will be cartelized by any majority government—in the context of a case study of the Brazilian *Câmara dos Deputados* (Chamber of Deputies). Our main question concerns when consistent agenda control by a single majority coalition, as opposed to agenda control by shifting majorities, has emerged in the post-1988 *Câmara*. Consistent agenda control emerges routinely in parliamentary regimes: the government commands a majority in the assembly; the legislative agenda is negotiated among the governing parties, typically with each able to “veto” the placement of bills on the agenda. However, the *Câmara* faces an external executive, the president, with substantial formal powers to set its agenda.

Consistent agenda control thus can emerge only if the president chooses to ally with a majority coalition in the assembly. If the president always chose to form such an alliance—a presidentially-led agenda cartel—then one would expect some consistently parliamentary patterns in Brazil: the appointment of legislative party leaders to the cabinet; the use of statutes rather than decrees to achieve policy goals; the avoidance of bills that split the governing coalition. We find that only the Cardoso presidency displays consistent evidence of such a presidentially-led agenda cartel. In this sense, our argument differs from that of Figueiredo and Limongi (1999; 2000), who argue that presidents have consistently pursued a parliamentary mode of governance in Brazil. Yet it also differs from those who argue that presidents have consistently pursued a shifting-coalitions strategy. Our results suggest that presidents make a strategic choice, with much hinging on that choice.

Agenda Power in Brazil's Câmara dos Deputados, 1989-1998

Introduction

Recently, a new wave of research has investigated the structure of veto and proposal power within democratic assemblies, in order to derive testable implications about the legislative process.¹ In this paper we explore the proposition that all majority governments in systems allowing joint tenure of legislative and executive posts form what we call parliamentary agenda cartels. An agenda cartel—at least in its ideal type—is any mechanism for ensuring that the legislative agenda is first hammered out within the cartel, then imposed on the assembly. A *parliamentary* agenda cartel is one in which the “hammering out” stage is such that each component party of the cartel has a veto on the placement of items on the agenda, with the “imposition” stage then proceeding either through extraordinary powers wielded by the government (e.g., the vote of confidence), the marshaling of party discipline by all the partners, or some combination of the two.² Here, as will be seen, we stress that cartels tend to allocate to their own members a controlling share of the official posts to which substantial agenda-setting powers are attached (ministers, committee chairs, Speakers, conferees).

It is common to hear that governments in parliamentary systems set the agenda in this two-stage fashion (hammering out, then imposing). We focus here on a presidential system, that of Brazil, and examine how well the cartel thesis holds up in its lower house,

¹ See, for example, Döring (1995, 2001), Huber (1996a), Krehbiel (1998), Cox, Masuyama and McCubbins (2000), Cox and McCubbins (2002), Campbell, Cox and McCubbins (2002), Tsebelis and Money (1997), Tsebelis (2002), Weingast and Marshall (1988), Laver and Shepsle (1996), and Heller (1997).

² On confidence procedures, see Huber (1996b), and Diermeier and Feddersen (1998). On party discipline, see Aldrich and Rohde (1997), Cox and Poole (2002), Snyder and Groseclose (2000).

the *Câmara dos Deputados* (Chamber of Deputies). Brazil is a good choice for exploring our thesis for two reasons. First, it allows the joint tenure of legislative and executive posts (or, more precisely, those who accept cabinet posts can resume their legislative seats at will, upon resigning their portfolios). Second, it has exhibited both majority and minority governments. We can thus look within a single case, with much held constant, to see if majority government does entail cartelization of the agenda.

Recent studies of the *Câmara* suggest contrasting answers to this question. On the one hand, Figueiredo and Limongi (1999; 2000) depict Brazilian politics since the promulgation of the 1988 Constitution as operating in a parliamentary mode, with presidents constructing stable support coalitions in the Congress and ruling through them. On the other hand, Ames (2001) depicts Brazilian politics as far more fluid, with presidents constructing a series of ad hoc coalitions for different issues and purposes. Although they do not use our terminology, Figueiredo and Limongi's work suggests the existence of agenda cartels, while Ames' suggests their absence.

In our view, Brazil's assembly has the potential to oscillate between parliamentary and shifting-coalitions modes, depending on presidential strategy. Some Brazilian presidents might assemble *minority* support coalitions in the legislature and choose *not* to subordinate their agenda power to the coalition's collective leadership. That is, parties in the president's support coalition would have no guaranteed right to "veto" the placement of bills on the legislative agenda, as their parliamentary counterparts (in majority governments) typically would. Other Brazilian presidents, in contrast, might choose to build a deeper, parliamentary-style support in the legislature. The president would cement his coalition by distributing positions in his cabinet to key party politicians and coordinating the exercise of his agenda powers with his partners (Abranches 1988; Ames

2001, p. 162-167; Amorim Neto 2002; Figueiredo and Limongi 1999; 2000). In this way, the president could combine his own agenda powers with those of a legislative majority and the coalition thus formed could operate along the lines of a majority government in a parliamentary system.

In the rest of the paper, we proceed as follows. The first three sections define what an agenda cartel is, describe how to detect cartels empirically, and provide background information on Brazil's Chamber of Deputies. The next four sections provide evidence on the structure of veto power in Brazil and test the cartel thesis. We show that Brazil has experienced only one true majority government since the promulgation of the newly democratic Constitution in October 1988, that of Cardoso. Moreover, it is only under Cardoso that an agenda cartel formed.

The cartel thesis

What is an agenda cartel?

In all national assemblies of which we are aware, there are certain offices to which extraordinary agenda powers attach. Only the Speaker of the U.S. House of Representatives, for example, can grant recognition for motions to suspend the rules. Only Ministers of the Crown can propose new taxes in the U.K. Only the Brazilian president can unilaterally force legislative action via the presidential urgency procedure (discussed below).

We define an agenda cartel as a set of agents possessing two key properties. First, they collectively hold a controlling share of the agenda-setting offices relevant to a given assembly. Thus, just as an economic cartel collectively monopolizes an economic resource, such as oil, so an agenda cartel collectively monopolizes a legislative resource, agenda-setting offices. Second, the cartel establishes a procedure for agreeing on which proposals

will be allowed access to the plenary session. Whether decentralized or centralized, formal or informal, this procedure amounts to investing k groups within the cartel, C_1, \dots, C_k , with vetoes over the placement of proposals upon the plenary agenda.

Two subspecies of agenda cartel are worth noting, by way of illustration. First, in parliamentary systems, it is often said that each *pivotal* party in a multi-party majority coalition wields an agenda veto.³ In this case, the groups C_1, \dots, C_k that wield agenda vetoes correspond to the pivotal parties in government. We call this a *parliamentary* agenda cartel. Second, Cox and McCubbins (2002) suggest that any majority of the majority party can veto the placement of items on the floor agenda in the U.S. House of Representatives. In this paper, it is the first subspecies of agenda cartel—the parliamentary agenda cartel—that will be relevant.

When a parliamentary agenda cartel exists, it is as if the legislative agenda were set as follows. Whoever wishes may introduce bills. In order for a bill to advance to the plenary session under the current government, however, it must be acceptable to each veto player, C_1, \dots, C_k .

There are two ways to model these unwritten partisan vetoes. In the simplest model, the vetoes are not subject to override. One ignores, in other words, the possibility that C_k 's coalition partners might send a bill to the floor even after C_k has “vetoed” it, perhaps in the belief that C_k is bluffing and will not really bring down the government over this issue. In this model, the veto players should never lose (i.e., have an unwanted policy change forced upon them). In various more complex models, the possibility of “overriding” vetoes would be brought more fully into view, veto players could in some cases lose, but their vetoes

³ By a pivotal party we mean one whose withdrawal would deprive the government of a majority in the assembly. This is the conventional definition in the literature on government formation. See, e.g., Laver and Schofield (1990).

would still be valuable.⁴ We prefer the simpler model, which exaggerates the power of the vetoes created in a parliamentary agenda cartel, as our purpose here is to underline the primary issue (there are vetoes), not the secondary issue (that the vetoes might be overridden).

What is a government?

We shall say that a legislative party is “in government” if at least one of its members holds a cabinet portfolio.⁵ A majority (minority) government is one in which cabinet portfolios are distributed to parties that collectively hold a majority (minority) of seats in the assembly.

The cartel thesis

The cartel thesis is that, if a majority government forms, then it will also constitute an agenda cartel. For present purposes, we advance this thesis simply as an empirical generalization to be tested, rather than deriving it as a conclusion from more primitive assumptions. Its theoretical status is thus similar to the observation that, if a multi-party government forms in a parliamentary system, then each party’s share of portfolios will closely reflect its share of seats in the assembly (Browne and Franklin 1973, Budge and Keman 1990, ch. 4, Laver and Schofield 1990, ch. 7, Schofield and Laver 1985).

⁴ To briefly illustrate one more complex model, suppose that some members of a cartel “disrespect” a veto issued by one of its members, by cooperating with the opposition if need be. They thereby confront the vetoer with a choice of backing down (allowing the current government to continue and the offensive bill to be considered) or resigning (bringing the current government down, thereby postponing action on the bill until a new government can form). Given complete information (all parties know each other’s preferences), a threat to resign would either be transparently credible (the threatening party really would prefer to bring down the government, rather than see the bill passed) or transparently non-credible (else). Thus, allowing “disrespect” and assuming complete information would mean that an agenda cartel might split on some bills, leading to some governing parties being rolled. Even in this model, however, parties in the cartel could veto some bills, in a way they could not had they not formed a cartel. One would thus expect parties’ roll rates to be lower when they were in government, all else equal—a proposition for which we provide evidence in Table 2.

⁵ Sometimes in Latin America a legislator belonging to a particular party will take office as a Minister purely as an individual, without his or her party’s endorsement. We discuss how we handle such cases in a later section.

Both the claim that agenda vetoes are distributed to each pivotal party (the parliamentary cartel thesis) and the claim that portfolios in parliamentary systems are distributed proportionally to seat shares characterize the nature of the government bargaining outcomes that emerge in equilibrium. Theoretical models of the government formation process should then accommodate these empirical regularities, to the extent that they are empirically validated. A primary purpose of this paper is to see how well the parliamentary cartel thesis extends to the case of Brazil, where it has been claimed that governments form and govern in parliamentary fashion.

Identifying cartels

How can one test for the existence of an agenda cartel? Some scholars test assumptions about who wields vetoes in a given legislature by examining law production (e.g., Döring 1995, Krehbiel 1998, and Tsebelis 2002). The notion is that the more veto players and the more divergent their preferences, the harder it will be for them to agree on any significant new laws. We prefer a more direct test hinging on the observation that, if a coalition partner *C* wields a veto, then *C* should never *unsuccessfully* oppose the passage of a bill (following Cox, Masuyama and McCubbins 2000, Cox and McCubbins 2002, and Campbell, Cox and McCubbins 2002).

Operationally, if a majority of a party votes against a bill that nonetheless passes, we say that the party has been *rolled*. Think of a legislative train leaving the station and a party that has tried to stop it—but been run over. Prior to the final passage stage, there are also sometimes clear agenda-setting votes—that is, votes to determine whether the legislature will or will not consider in plenary session a particular bill. We also speak of parties being rolled on these initial agenda-setting motions, when they vote against them but the motion nonetheless passes. If a party wields a veto, it should *never* be rolled.

Cox, Masuyama and McCubbins (2000) find that governing parties in parliamentary systems typically have positive but small (below 5%) roll rates, as do majority parties in the U.S. House (Cox and McCubbins 2002) and Senate (Campbell, Cox and McCubbins 2002) since the late nineteenth century. These empirical findings suggest that the simplest veto model, in which vetoes cannot be “overridden,” does indeed oversimplify. Thus, rather than take a zero roll rate for all partners as indicating the presence of a parliamentary agenda cartel, we adopt a more pragmatic standard and use 5% as the cutoff value defining what a “low” roll rate is. Theoretically, we are implicitly admitting the possibility that bills may arise that one governing partner dislikes enough to vote against, but does not dislike enough to resign in protest about and thus bring down the government.

What if there is no agenda cartel and no party wields a veto? If we assume that all parties can be placed along a traditional left-right scale, so that successful bills necessarily propose to move policy toward the median legislator’s ideal point, then we have a very simple expectation: *The median party is never rolled, while roll rates increase monotonically both to the left and to the right.*

The intuition behind this result is straightforward. The median party cannot be rolled because it is not possible to form a majority that wants to move policy away from the median in a unidimensional model. That roll rates increase to either side of the median can be illustrated by imagining that a particular status quo policy lies between two right-wing parties’ median ideal points and that a bill proposing to move policy leftward is passed (see Figure 1). The more extreme party (R2 in the Figure) will necessarily vote against the bill, as it seeks to move policy farther away from its ideal; hence, it will be rolled. The more moderate party (R1 in the Figure) may vote for the bill, if it is closer to the party’s median ideal point than is the status quo. In this case (pictured in Figure 1), the moderate party is

not rolled. Generalizing this example, one can show that the roll rate of the more extreme party must be higher than that of the more moderate party—and this is true to the left of the median party as well.

Figure 1 about here.

Thus, we have a general test for the *absence* of an agenda cartel. If there is a clear U-shaped pattern in party rolls, viewed across the left-right spectrum, then there cannot be an agenda cartel.⁶

In the specific case of Brazil, we identify cartels as follows. First, we identify the president's nominal support coalition, defined as all parties any of whose members hold cabinet portfolios. We begin with the president because he has such substantial agenda-setting powers in Brazil that no agenda cartel can form without him.⁷ Second, we examine the roll rate of each party in the nominal support coalition (that is, the percentage of bills scheduled or passed against their wishes). If the president has forged a parliamentary agenda cartel, then the roll rate of each party in that cartel will be zero or, more leniently, as low as the observed rate for government parties in parliamentary systems. Third, we examine in greater detail how the president distributed his portfolios. If he indeed sought to

⁶ A U-shaped pattern in party rolls clearly precludes left-connected and right-connected cartels. But what if a cartel consists only of centrist parties? In this case, we would expect all the parties in the cartel to have near-zero roll rates, whereas in the absence of a cartel only the median party would have such a roll rate. Thus, a U-shaped pattern clearly precludes a “centered” cartel only if the parties immediately to the left and right of the median party have significantly higher roll rates than does the median party. This of course may be asking a lot of the data, in the sense that, even if it were true that no cartel existed, there might not be enough policies on which the median party and the party immediately on its right (left) disagreed to generate a significant increase in the latter's roll rate.

⁷ Recall that by definition an agenda cartel includes a controlling share of agenda-setting offices. As we shall see, the president has such large powers that it is not possible to create a coalition that excludes him and yet can control the agenda.

forge a parliamentary-style coalition, then one expects each party in the support coalition to wield a share of portfolios comparable to their share of seats. Fourth, we examine the president's relative use of statutes and decrees. If a parliamentary agenda cartel has been formed, then the president should use it, meaning that he will seek statutory or constitutional implementation of his legislative goals, rather than decree-based implementation. If a coalition has low roll rates, and secures a good representation in the cabinet of a president who seeks statutes rather than decrees, we shall consider it to be a cartel. In some cases, we can also provide qualitative evidence to complement our more systematic data.

Brazil's legislative process

In this section, we review Brazil's legislative process. After surveying the basics of the system, we focus on the structure of internal (legislative) and external (presidential) agenda power. Our main points are simple: agenda power is concentrated in Brazil and it is delegated to party leaders; however, an external agent—the president—also wields substantial independent power over the agenda.

Basics

Brazil has a bicameral legislature. Although the powers of the two chambers are symmetric, we shall only consider the Chamber of Deputies, as roll call data for the Senate were not available for our time period.

Individual members of the *Câmara* are entitled to introduce bills. Any legislative initiative is referred to the committee under whose jurisdiction it falls. Committees can either approve (totally or partially), amend, reject, or propose wholesale substitutes to the bills submitted to their consideration. The 1988 Constitution attempted to strengthen the

role of committees by endowing them with the prerogative to enact bills (under some specified circumstances) without reporting them to the floor. Should a bill be either approved or not enacted by the committee, then it is referred to the floor for consideration by the full Chamber. Floor amendments to the bill are put to a vote first. Then, the whole bill (*project* in Brazil's legislative jargon) is voted on globally (*em globo*, in Portuguese), up or down.

There are three types of votes in the Chamber of Deputies: secret votes, voice votes, and roll call votes. Secret votes are taken on motions to overturn presidential vetoes, motions to set up investigative committees, and impeachment trials of presidents, legislators, and judges. Voice votes are convenient and frequent but any deputy can, after the result of a voice vote is announced, request a quorum count to verify the presence of a majority. A quorum count request supported by at least 6% of the Chamber membership triggers a roll call vote. Support by 10% of the Chamber membership is required for a separate roll call on amendments. Quorum counts and roll calls are usually requested by opposition parties so as to force the majority to publicly disclose its position. However, there is a limit to the opposition's ability to request quorum counts. The Chamber's standing orders allow that a quorum count can be requested only one hour after the result of a previous roll call is proclaimed. This rule is designed to prevent the opposition from paralyzing floor decision-making by requesting quorum counts all the time.

Legislative Agents and Agenda Control

Despite these unusual constitutional powers, Brazilian committees are relatively weak, often overruled by party leaders' petitions to discharge bills by means of urgency requests (Pereira and Mueller 2000) (we will elaborate more on urgency requests below). In contrast, political parties, despite being very weak in the electorate (Mainwaring 1999,

p.88-174), are important in the organization of legislative business in the lower house, along with the Mesa Diretora (the Chamber's steering board) (Figueiredo and Limongi 1999; 2000). Article 175 of the standing orders stipulates that the Mesa chair (the presiding officer of the Chamber) organizes the legislative agenda in consultation with the so-called College of Leaders. This is the most important decision-making body of the lower chamber. It is composed of leaders of parties commanding at least 1.0% of seats and the government leader (the president is entitled to appoint a deputy to act in his name and to make vote recommendations to the floor). The standing orders stipulate that the College's decisions should be made preferably by consensus. If consensus is not possible, however, decisions are to be made by an absolute majority of votes, each vote weighted by the percent of seats held by each leader's party. A party leader's signature also carries the weight of her party delegation on a petition to request a roll call or urgent consideration. Such procedural rights to represent their delegations give party leaders considerable control over the floor, and helps centralize decision making in Brazil's otherwise highly fragmented legislature (Figueiredo and Limongi 2000, p.164-165).

Another rule enshrined in the standing orders that strengthens party leaders and weakens committees concerns "urgency." There are two types of urgency motion: simple urgency and super urgency.⁸ Two-thirds of the Mesa membership, one-third of the Chamber membership (or party leaders representing this number) or two-thirds of a committee membership can request simple urgency on a bill. For simple urgency to be granted, a simple majority must support it in a voice vote. Simple urgency merely allows a bill to be voted on sometime in the same legislative session (a legislative session spans over

⁸ Super urgency is our translation from the Portuguese of what in the Brazilian legislative jargon is called *urgência urgentíssima*.

five months). Moreover, only two bills can be considered under simple urgency per session.

Because of these restrictions, especially the last, simple urgency does not provide a regular means for the opposition to upset the governing coalition's agenda. However, on occasion the opposition can exploit the rule. As an example, consider the wealth tax in Cardoso's first presidency. When Cardoso was a left-leaning senator in the late 1980s, he sponsored a bill taxing wealth. This bill was held up in committee for a good while. When Cardoso took the presidency in 1995, supported by a center-right coalition, the leftist opposition decided to challenge him by requesting urgency on his long-forgotten bill. The Cardoso coalition was against it. Much to Cardoso's embarrassment, his coalition leaders closed ranks to defeat the request on the floor.

As for the super urgency motion, it must be requested by means of a petition signed by either an absolute majority of the Chamber membership or party leaders representing this number. To be granted, a super urgency petition must be approved by an absolute majority of the Chamber membership in a floor vote. If super urgency is granted on a bill, it is immediately discharged from committee and goes to the top of the floor's voting schedule.⁹ Figueiredo and Limongi (1999, p. 58) report that, of the 514 laws enacted by the Congress in 1989-1994, 282 (55.0%) were urgently considered in the Chamber of Deputies.

The Role of the President

Brazil's 1988 Constitution gives the president a key role in lawmaking. The president has the right to propose bills and constitutional amendments on any topic and has *exclusive* legislative initiative in a host of areas, particularly those pertaining to public

⁹ Super urgency appears analogous to "extractive" special rules in the U.S. House, with the *Mesa* in the role of the Rules Committee.

administration, tax policy, and the budget. The president also has the prerogative to partially or totally veto bills passed by the Congress (presidential vetoes are overridden by an absolute majority in a joint session of Congress). Furthermore, the president's constitutional prerogative to issue provisional measures (or decree-laws) enables him to exert considerable control over the legislative process.

Provisional measures are presidential decrees with the immediate force of law. Once a provisional measure is issued, the Congress has 30 days to vote on it. If the Congress does not take any action in this period, the provisional measure elapses. In most cases, the Brazilian Congress has failed to promptly deliberate on provisional measures. However, a Supreme Court ruling in 1989 authorized the executive to re-issue provisional measures that the Congress had not considered in due time (Figueiredo and Limongi 1997).¹⁰ The executive was quick to seize this opportunity. Not surprisingly, of the 3,412 provisional measures emitted between October 1988 and February 1999, only 498 (14.6%) were original documents. Only 20 of these 498 original measures were voted down by the Congress (9 issued by Sarney, 10 by Collor, and 1 by Cardoso).¹¹ Moreover, the executive has been resorting to provisional measures to legislate on all kinds of policy areas in any context, despite the fact that the Constitution states that provisional measures should deal only with urgent and relevant matters. For example, even fishing rights in the Amazon River have been regulated by provisional measures. In short, presidential decrees have

¹⁰ Note that in September 2001 the Brazilian Congress enacted a constitutional amendment determining that provisional measures would have to be voted on in 60 days, and could be re-issued only once.

¹¹ These figures were culled from Brazil – Senado Federal (1999).

become a powerful policy-making instrument because they allow the executive to unilaterally change the status quo.¹²

According to Figueiredo and Limongi (2000), “Rights to exclusivity and the power to issue decrees with the immediate force of law give the executive the capacity to control the legislative agenda in both its time and content” (p. 156). The data presented by the authors show that no less than 86% of the bills enacted in 1989-1997 were sponsored by the executive.

Finally, the president is constitutionally entitled to request urgent consideration of his legislative proposals. There is no vote on the issue of granting urgency to the president. The Chamber of Deputies and the Senate have 45 days to deliberate on any bill deemed urgent by the president. Should either house fail to meet this deadline, the executive bill is immediately put to a vote. In case one of the houses amends the bill, the other house has 10 days to decide on the amendments. The chambers can take as long as they wish in considering the bill but must complete their consideration of it before moving on to any other matter (for further details, see the rules posted at www.camara.gov.br). Available evidence shows that 53% of the executive-initiated bills enacted by the Congress in 1989-1994 were urgently considered in the lower chamber. Also, in this same period urgently considered executive bills took on average 26 days to be shuttled to the Senate (Figueiredo and Limongi 1999; p.62-63). Unfortunately, it is not known how many urgency requests were actually made by the president himself or by his legislative allies. At any rate, the grant of urgency has been a key mechanism to expedite deliberation on the executive’s legislative agenda.

¹² On the politics of provisional measures in Brazil, see Amorim Neto and Tafner (2002), Figueiredo and Limongi (1997; 1999; 2000), Monteiro (2000), Power (1998), and Reich (2002). On decree powers in a comparative perspective, see Carey and Shugart (1998).

Roll rates in Brazil

Data

To identify presidentially-led cartels we will analyze roll call votes on projects and on agenda-setting motions.¹³ A roll call on a project is equivalent to a final passage vote in the U.S. The main form of agenda-setting motion is an urgency request; however, we include others as well.¹⁴

As there are many small parties in the Brazilian Chamber, we focus here on the roll rates only for Brazil's "big seven" parties: the PMDB (Party of the Brazilian Democratic Movement), PFL (Party of the Liberal Front), PSDB (Party of the Brazilian Social Democracy), PT (Workers' Party), PPB (Brazilian Progressive Party),¹⁵ PDT (Democratic Labor Party), and PTB (Brazilian Labor Party). These seven parties held together approximately 96.0% of lower chamber seats in the 1987-1991 legislature, 77.0% in 1991-1995, and 83.0% in 1995-1999.

Despite being often characterized as mostly clientelistic organizations, many legislative scholars agree on the relative left-right placement of the "big 7" parties in Brazil (Coppedge 1997; Figueiredo and Limongi 1999, ch. 4; Mainwaring 1999, ch. 4; Rosas and Zechmeister 2000). The consensus places the PT on the left; the PDT and PSDB on the

¹³ Note that by focusing on roll calls a good deal of information on floor decisions will be lost because, as mentioned, there are also secret votes and voice votes in Brazil. However, roll calls do constitute a sample of the most controversial decisions made on the floor (Figueiredo and Limongi 1999).

¹⁴ The agenda-setting votes that we include are: urgency requests, petitions to anticipate consideration of a bill, the admissibility of a presidential decree, petitions to extend a legislative session, proposals to dismember a bill, petitions to end a floor debate, petitions to withdraw an urgency request, petitions to withdraw bills from the agenda, proposals to vote on a report on a bill, and petitions to nullify the enactment of a bill by a committee, and petitions to give priority to a bill.

¹⁵ The PPB was formed in 1995 as a result of the merger of the PPR and the PP. The PP was created in 1993 by the merger of the PST and PTR. The PPR resulted from the merger of the PDS and the PDC in 1993. For the purpose of simplicity the Figueiredo and Limongi roll-call data bank treats all these right-wing parties as a single party for the whole 1989-1999 period. In this paper we follow their procedure.

center-left; the PMDB in the center; the PTB on the center-right; and the PFL and PPB on the right.¹⁶

In principle, we would present roll rates for each presidential cabinet as identified by Amorim Neto (2002, p. 56), examining them to see if parties in the president's coalition had low roll rates or not. In practice, not all presidential cabinets lasted long enough to generate a significant number of usable roll calls, so we have combined some adjacent cabinets, when one or more parties served in all of them (under the same president). After combining, the periods we examine are Sarney 3 (i.e., Sarney's third cabinet, the dates of which are given in Table 1), Collor 1, Collor 2, Collor 3+4, Franco 1-5, and Cardoso 1+2.¹⁷

Results

Roll rates on project and agenda-setting votes for each party in each presidential cabinet (or set of adjacent cabinets) are displayed in Table 1 below. The first step is to determine, for each cabinet (or set of cabinets) whether all parties consistently in the president's nominal support coalition exhibit "low" (below 5%) roll rates, as expected in the presence of a parliamentary agenda cartel.

[Table 1 about here.]

¹⁶ Were we to use the ideological classification provided by Mainwaring, Meneguello, and Power (2000), the main change would be the PSDB taking the center position in 1995-1998 and the PMDB going to the center-left in this same period. This would not alter our conclusion, articulated and defended in the text below, that there was a solid presidentially-led cartel in this period.

¹⁷ Readers interested in a finer-grained breakdown of the data may contact Octavio Amorim Neto at oamorim@fgv.br.

By the 5% standard, one can clearly reject the notion that a cartel existed under Collor 1, Collor 3+4 and Franco 1-5.¹⁸ In the first of these periods, a member of the PMDB held a portfolio and yet the party's roll rate exceeds 20%—over four times higher than the highest figure for a governing party in any parliamentary system we know, except for cases of minority government (Damgaard and Svenson 1989). In the last two of these periods, the PFL held portfolios and yet its roll rate exceeds 15%. Sticking strictly to the 5% criterion, one can also reject the notion that Sarney organized a cartel in his third cabinet (Sarney 3), although here the PFL's roll rate (5.6%) is close enough to the (admittedly rough) threshold that additional information is needed before one can reach a firm conclusion. Finally, Cardoso 1+2 passes the first test, in that no party holding portfolios throughout these cabinets had roll rates above 5%. The only exception is the PPB, which joined Cardoso's cabinet only in April 1996, and whose roll rate is 6.2%. We ignore Collor 2 henceforth, as it spans only a few months and entails only two roll calls.

Consider next whether U-shaped patterns in the party roll rates appear, as would be expected in the absence of a parliamentary cartel. Surveying the data in Table 1, U-shaped patterns appear only in Sarney 3, Collor 3+4, and Franco 1-5. Pooling all the data from these three periods, the Spearman correlation between a party's ordinal distance from the PMDB and its roll rate is .93 (for the PMDB and all parties to the left) and .70 (for the PMDB and all parties to the right). Both correlations are significant at the .01 level. Winning coalitions in these periods were most often right-connected; that is, the winning

¹⁸ Note that we are dealing here with the universe of relevant votes, not a sample. From this perspective, we can be sure that these roll rates exceed 5%. If one wishes to view the actually observed roll calls as samples from a larger universe of "what might have happened" under the given president, then the issue arises as to whether the observed proportions could have been generated by random sampling from a population with mean 5% roll rate. From this perspective, one can reject the null of sampling from a population with mean 5% roll rate at the .14, .06 and .10 levels, respectively, for Collor 1, Collor 3+4 and Franco 1-5.

parties consisted of all those to the right of a certain point on the left-right spectrum. However, left-connected winning coalitions, consisting of all those to the left of a given point, also appeared with some frequency. This is consistent with the supposition that presidents chose different allies on different issues, as best suited their immediate needs; or with the supposition that legislative initiatives came from both the left and the right, with some of each succeeding; or both.

All told, only one period, Cardoso 1+2, clearly satisfies our initial criteria for identifying the existence of an agenda cartel. In this period, the parties PSDB, PMDB, PTB, and PFL were continuously in government and all had roll rates below 5%. Moreover, there is no systematic trend in their roll rates across the ideological spectrum. The opposition parties, in contrast, have quite high roll rates, which increase the further they are from the median party.

Having looked at roll rates, we next turn to two other clues as to the president's legislative strategy. If the president has decided to form a stable legislative majority and govern through it, then one should find that he tends (1) to construct his cabinet out of partisan rather than technocratic materials and also (2) to prefer standard lawmaking procedures to decrees.

Cabinet construction

The appointment of party politicians to the cabinet has been considered the president's key instrument to build legislative support in Brazil (Ames 2001, p. 162-167; Amorim Neto 2002; Figueiredo and Limongi 1999; 2000). We claim that the better is a party's representation in the cabinet, the lower its roll rate will be. This might follow because cabinet positions are bribes that buy parties' votes; or because cabinet positions

indicate who the president's legislative partners are, with each partner able—as in a parliamentary government—to veto objectionable legislation.

To measure a party's representation in the cabinet, we employ two different statistics. Our first measure is *Cabinet Time Per Seat*. For example, imagine a cabinet with 20 ministries. If a given party heads one ministry the whole year, and another ministry during half of the year, the cabinet time spent by the party is $(365 + \frac{1}{2} * 365) / (20 * 365) = 0.075$.¹⁹ Dividing this figure by the legislative size of the party in the lower chamber gives the *Cabinet Time Per Seat*.²⁰

Cabinet time, however, tells us about only the bare bones of parties' representation in the executive branch. To add some flesh, we consider the budget resources allocated to parties by presidents, using an indicator devised by Amorim Neto and Santos (2001). This measure counts the percent of time a party heads each ministry per year and multiplies it by the percent share of the civilian budget spent by each ministry in the year. The values are then added up. For example, suppose a party headed ministry X the whole year, and ministry Y during half of the year. If ministry X spent 20% of the civilian budget, and ministry Y 10%, then the party was allocated $20\% + 10\% * \frac{1}{2} = 25\%$ of the civilian budget

¹⁹ Data on the party affiliation (if any) of cabinet ministers were culled from Abreu et al. (2001), and provided by Antônio Octávio Cintra and José L. M. Dias. Additional sources include: for Sarney: *Keesing's Contemporary Archives*, vol. 31, n. 6, 1985, p. 33642-33650; *Veja* (a weekly magazine) February 12, 1986, p. 16-21; *Veja*, January 11, 1989, p. 34-36; for Collor: *Veja*, March 14, 1990, p. 26-31; *Veja*, April 15, 1992, p. 18-26; for Franco: *Veja*, October 7, 1992, p. 34-49; *Jornal do Brasil* (a Rio de Janeiro-based daily newspaper), August 20, 1993, p. 2; *Jornal do Brasil*, August 21, 1993, p. 4; *Jornal do Brasil*, August 29, 1993, p. 12; for Cardoso: *Istoé* (a weekly magazine), January 4, 1995, p. 21-2.

²⁰ Note that, given frequent party jumping in Brazil, we used the yearly legislative size of the parties to calculate the cabinet time per seat.

in the year Y . Dividing this figure by the party's legislative seat share yields our second measure of cabinet representation, *Budget Share Per Seat*.²¹

The dependent variable is the yearly number of rolls of each of the seven big parties in 1989-1998, thus generating a sample with $7 \times 10 = 70$ observations. As our *explanandum* is a frequency count variable, we ran an extended beta-binomial model (Palmquist 1999). Given the panel structure of the sample, we included the first-order lag of the dependent variable on the right-hand side of the equation to control for auto-correlation in the residuals.²² We also include six dummies to control for the parties' fixed effects, using the PMDB as the baseline. These dummies allow us to check whether a party's ideological distance from the center (which we know ordinarily from conventional left-right placements of the parties) is positively associated with its roll frequency.

[Table 2 about here.]

Table 2 displays our results, which support two main conclusions. First, the better is a party's cabinet representation—measured either by *Cabinet Time Per Seat* or *Budget Share Per Seat*—the lower is its frequency of rolls per year. The former effect (which takes account only of time spent in the cabinet) is statistically significant at the .10 level, the latter (which weights each Ministry by its budget share) at the .01 level. Second, the greater the ideological distance of a party from the center, the higher its roll rate tends to be. This effect is stronger for the left-wing than for the right-wing parties because at least one right-wing party was always represented in the cabinet (the PFL served on the cabinet

²¹ Data on budgetary expenditures in 1993-1998 were provided by the *Secretaria de Orçamento Federal* (Federal Budget Office) upon e-mail request. For the 1989-1992 period the source was Brazil – Ministério da Fazenda (N.d.).

²² Because we include a lag, the number of observations falls to 63. All our results are qualitatively similar if no lags are included.

every year in 1989-1999); and two of the four presidents were right-of-center (Sarney and Collor);—thus insulating to a great extent even opposition right-wing parties from unwanted policy proposals.

There is a good reason to prefer the *Budget Share Per Seat* variable to the less informative *Cabinet Time Per Seat*: when we include both variables in the analysis, the coefficient on *Budget Share Per Seat* is largely unaffected (and retains its significance), while that on *Cabinet Time Per Seat* becomes small and insignificant.

The substantive impact of variations in a party's *Budget Share Per Seat* is illustrated in Figure 2, which arrays the seven main parties from left to right along the horizontal axis. Two different roll rates are plotted along the vertical axis: first, the roll rate that the model predicts, if the party's budget share per seat is zero (it is not in government at all); second, the roll rate that the model predicts, if the party's budget share per seat is unity (i.e., it gets a budget share equal to its seat share).²³ We shall call these two roll rates the “opposition” and “government” roll rates, respectively. Two things can be seen from the figure.

Figure 2 about here.

First, each party's predicted opposition roll rate (when its budget share per seat is zero) is higher than its predicted government roll rate (when its budget share per seat is unity). Subtracting each party's government roll rate from its opposition roll rate, the

²³ One might argue that a budget share per seat of unity is too low to reflect full membership in the cabinet. After all, if only a fraction of the parties in the Chamber get into government, and they divide the full budget among themselves, each will have a higher-than-unity budget share per seat. However, Brazilian cabinets always contain non-party ministers, who take up a certain portion of the budget. Thus, a value of unity does reflect a “full” membership in the cabinet.

median figure is 11%. Averaging across the seven parties, a party is predicted to be rolled 63 percent more often when in the opposition than when in government.²⁴

Second, roll rates tend to increase both to the right and especially to the left. The only exception to this pattern, in Model 2, concerns the PPB—whose predicted roll rates are *lower* than those of two parties to its left: the PTB and PFL. This unexpected result may stem from the fact that the label PPB in the Figueiredo and Limongi roll-call data bank is an artificial conflation of the labels of four other parties (PDS, PPR, PP, and PDC) that in different moments in time merged in pairs till they finally fused into the PPB in 1995 (see footnote 10). Such a conflation is bound to overstate the conservatism of some of these legislative cohorts, particularly that of the PDC and PP, which are defined by Coppedge (1997) and Mainwaring (1999, p. XVIII) as center-right rather than rightist parties. Ignoring the PPB, the other six parties “scale” perfectly.

Choice of policy instrument

We now turn to the second dimension of the president’s legislative strategy, his choice of policy-making instrument. In Brazil, this choice is between what we call standard lawmaking procedures (statutes, complementary laws and constitutional amendments), on the one hand, and decree-laws, on the other.

If the president is able to form a legislative cartel, then he will typically have enough political support to pursue his legislative agenda by standard lawmaking procedures, rather than by decrees. If the president is unable or unwilling to form a cartel,

²⁴ The increase in the roll rate is expressed here as a percentage of the government roll rate.

then his weak legislative support will predispose him to govern by a unilateral policy-making instrument, that is, decrees (Amorim Neto 1998).²⁵

To operationalize the degree to which presidents seek statutory, complementary or constitutional laws rather than decree-laws, Table 3 also provides the number of statutory bills, bills of complementary laws, constitutional amendments and original decree-laws initiated by the executive in each period. The last column in Table 3 displays the ratio of all standard lawmaking initiatives of the executive (statutory bills + bills of complementary laws + constitutional amendments) to the total legislative input of the executive per period, what we call the index of standard legislative initiatives (SLI). SLI varies between 0 and 1. The higher the score on SLI, the more presidents prefer to make policy via standard lawmaking procedures.

[Table 3 about here.]

As can be seen, the three *lowest* SLI values occur for the periods Sarney 3, Collor 1 and Franco 1-5. In each of these periods, as we have seen, there is a governing party with a roll rate above our 5% threshold. In the first and last of these periods, there is a U-shaped pattern on rolls. Thus, several signs point to the lack of a consistent presidentially-led cartel in these periods.

The second-*highest* value for SLI occurs in Cardoso 1+2. Moreover, under Cardoso the PFL and PSDB had their highest scores on *Budget Share Per Seat* in the whole 1989-1998 period; and we find the greatest stability in cabinet tenure of all the post-1988 presidencies. Thus, Cardoso 1+2 is the only period in which we observe consistency

²⁵ To approve a complementary law requires an absolute majority of the Chamber's membership, whereas the approval of statutes only takes a majority of the voting deputies. Thus, it is harder to pass complementary laws than statutes. Constitutional amendments are even harder to pass: they require a 60% majority of the Chamber's membership.

between the design of the cabinet (partisan), presidential policy-making strategy (statutory/constitutional), and a strong cartel in project and agenda-setting votes (with low roll rates for all parties in the Cardoso coalition).²⁶

Putting aside the cases clearly lacking a cartel (Sarney 3, Collor 1, and Franco 1-5) and the case clearly exhibiting a cartel (Cardoso 1+2), we are left with a somewhat odder case, Collor 3+4. Although this period exhibits a governing party with a high roll rate (the PFL) and a U-shaped pattern in roll rates, nonetheless the president relied heavily on statutes. Collor signed only 11 decrees but sponsored 259 statutes, 19 complementary laws and 2 constitutional amendments. This period's score on SLI (0.96) is thus the highest for our entire period.

Let us digress briefly to consider this puzzling case in more detail. Note first that Collor actually tried to cooperate with some legislative parties by means other than cabinet appointments. According to Power (2000, p.194),

With Collor's personal intervention in December [1990], Passarinho [a conservative senator] finally succeeded in creating the desired progovernment bloc in Congress.

This was the first such bloc created under the Constitution of 1988, which explicitly

²⁶ It could be argued that if we also look at the number of decrees that were simply re-issued or were re-issued with modifications in their texts, the nice consistency between cabinet design and presidential policy-making found in Cardoso 1+2 would evaporate. After all, Cardoso simply re-issued 1,997 decrees and re-issued 453 decrees with their texts modified, while Sarney re-issued 20 and modified 2, Collor re-emitted 20 and changed 21, and Franco re-issued 326 and modified 37. Presidents have to re-issue decrees when Congress does not vote on them in time. According to Amorim Neto and Tafner (2002), in general, Congress does not promptly deliberate on decrees so as not to waste its time on less relevant issues. Seventy percent of the decrees deal with minor questions relating to the grant of credits, transfers of budgetary appropriations, civil servants, and the organization of public administration. So when the executive re-issues a decree, this means that the Congress is implicitly delegating the executive powers to legislate on issues toward which the legislative majority is indifferent. Such delegation is more likely precisely when the president and the majority have colluded under a coalition agreement or, in the terms of this paper, have formed a presidentially-led cartel. As for the re-issuance of decrees with their texts modified, Amorim Neto and Tafner argue that this is a mechanism that allows deputies to make *ex post* amendments to original decrees, thus helping better coordinate the preferences of presidents and legislators who have colluded under a coalition agreement. The modifications effected in original decrees are designed precisely to address the demands pressed by the government's allies and not those of the opposition. As Cardoso led a strong cartel, this explains in part why he had the highest average of re-issued decrees with modified text.

permitted the formalization of legislative coalitions [...]. Called the Movimento Parlamentar Social Liberal [Social Liberal Parliamentary Movement] but known simply as Bloco, it was based formally on the PFL and PRN, but also received informal support from the PDS [later the PPB], PTB, PDC, and several microparties.

The Social Liberal Parliamentary Movement was cemented with the distribution of pork, particularly for the PFL deputies (Ames 2001, p.176-180). While the Parliamentary Movement certainly provided Collor with a firmer legislative basis than the one he had in 1990, the Bloco's parties never commanded a legislative majority in 1991-1992. So where could Collor obtain legislative support to approve 93.0% of the statutes he sent to Congress?²⁷

The answer appears to be that Collor struck a separate deal with the PDT. Indeed, the cooperation between Collor and the PDT was publicly avowed and cemented by side-payments.²⁸ According to newspaper reports, the state of Rio de Janeiro, then governed by the PDT's main leader, Leonel Brizola, received 576 million dollars in federal grants in 1991 as a consequence of the Collor-PDT alliance.²⁶ In return, the PDT's leaders in the Chamber of Deputies went from agreeing with Collor's vote recommendations 4.3% of the time in Collor 1 and 2, to 25.5% of the time in Collor 3+4. Interestingly, with the support from the PDT, which held 9.1% of lower chamber seats, the Social Liberal Parliamentary Movement (PFL + PRN + PDS + PTB + PDC = 44.2%) could provide Collor with a minimal winning majority of 53.3% of seats.

²⁷ Data provided by Argelina C. Figueiredo and Fernando Limongi.

²⁸ See *O Globo* (a Rio de Janeiro-based daily newspaper), "Brizola promete ajudar Collor" (Brizola [leader of the PDT] promises to help Collor), March 8, 1991.

²⁶ See *O Globo*, "Uma chuva de dinheiro no Rio" (a rain of money on Rio), May 23, 1991.

However, given that Brazilian parties are not perfectly disciplined, such a majority could never be taken for granted by Collor. The PMDB was still the pivotal party and Collor would have to come to terms with it. What the PMDB wanted the most was to have Collor stop issuing decrees as he did in 1990. In April 1991 the Chamber of Deputies nearly approved a bill sponsored by a PMDB deputy, Nelson Jobim, designed to place limits on presidential decree powers. Although the Jobim bill was defeated (by a very small margin), its message was clear, and seems to have impressed Collor and his advisers (Power 1998, p. 211). On top of it, in August 1991 the Chamber of Deputies voted down a presidential decree granting pay increases to public servants and the military. On this occasion, the PFL, considered Collor's staunchest supporter, joined the opposition.

In short, the *Câmara*, in practical terms, broke Collor's decree powers. He was thus left with only the alternative of using standard legislative procedures—explaining the very high SLI score for Collor 3+4. To achieve a high approval rate of his statutory bills, Collor abandoned his most-preferred (and conservative) policies, as demonstrated by Ames (2001, p. 192-194); and distributed pork to both his main supporters (the PFL) and to a strange bedfellow (the PDT). What he did not do was to turn the Social Liberal Parliamentary Movement into an effective presidentially-led cartel.

Nominal majorities, real majorities and the cartel thesis

Were any of the presidential cabinets we have studied majority governments? To answer this question, we first identify the *nominal* support coalitions of each president—the set of all parties any of whose members accept portfolios under the president. The share of seats held by the nominal support coalition for each president is easily calculated. Indeed, Deheza (1997) provides such figures for a variety of Latin American cases, including Brazil. For that matter, one can readily calculate the nominal support coalitions of prime

ministers in parliamentary systems. On the basis of these figures, one can divide presidents (and premiers) into those who command a nominal majority and those who do not.

Nominal support coalitions are of interest for present purposes only to the extent that they entail a trade, with the chief executive handing out portfolios in exchange for his legislative partners' delivery of a reliable bloc of votes in the assembly. The appointment of a legislator from a given party does not, however, invariably indicate such a trade. In Latin American presidential systems, for example, legislators sometimes accept portfolios as individuals, rather than as leaders of their respective parties. One would not expect a given party to offer reliable support to a president, merely because one or two of its members had accepted portfolios as individuals. Thus, it is important—both in general and in the particular case of presidential systems—to discount ministerial appointments that are known not to be the cement of an alliance.

In Brazil, the newspapers and the entries in Abreu et al. (2001) discuss the appointment of each minister, indicating whether the minister takes office as a representative of his party (and thus as part of a deal to deliver that party's votes to the president on a consistent basis) or as a mere individual. We have read the entries and newspaper accounts of each ministerial appointment in our time period and thus can identify each minister who was "endorsed" or "recommended" by their party and each who was not.

One way to discount the support of a party is to calculate the proportion of its ministers who are endorsed. If all its ministers are endorsed, this is consistent with the existence of a trade of portfolios for votes. If none of its ministers are endorsed, this is inconsistent with the existence of such a trade. Thus, instead of summing the seat shares of all parties any of whose members have portfolios, one discounts each party's seat share by

the proportion of its ministers who are endorsed, and then sums the resulting figures. This is one way to calculate the *effective* support of a president.

Another way to discount party support is, following Amorim Neto (2002), to examine how each party's share of portfolios compares to its share of seats in the assembly, among those parties with endorsed ministers. If a party is getting a share of portfolios that is proportionate to its share of seats (among the governing parties), then this echoes the parliamentary pattern of strict proportionality between seat and portfolio shares in the government and provides additional evidence consistent with a portfolios-for-votes trade.

Whether one discounts each party's seat share by the proportion of its ministers who are endorsed or by the ratio of each party's portfolio share to its seat share (among governing parties), one arrives at the same conclusion. By either definition of effective support, only Cardoso 2 is a real majority government. Several previous periods, such as Sarney 3 and Franco 1-5, exhibit nominal majorities. Once one discounts those parties with subpar representation in the cabinet—assuming that they would also deliver subpar portions of their own votes—all governments prior to Cardoso 2 are minority governments.²⁷

Focusing on “real” majorities, there is a perfect correlation: no minority government in Brazil formed an agenda cartel; the one and only majority government did

²⁷ Yet another way in which one might decide whether a particular president has majority support is more behavioral and yields the same conclusion. Using the data provided by Amorim Neto (2002, p. 64), we can calculate a president's “average support level” as the seat share of his nominal support coalition, times the average percentage of his nominal supporters who actually vote in accordance with the recommendations of the government leader in the assembly on critical roll calls (i.e., those on which at least 60% of the legislators vote and at least 20% of those voting are in the minority). If the parties in the nominal support coalition offer completely reliable support, then the average support level will equal the nominal coalition size; otherwise, the average support level will fall short of that size, reflecting the absence of a successful deal to trade portfolios for votes. Calculating the average support level for each presidential cabinet in our period, and defining majority governments as those with average support in excess of 50%, we find that—again—only Cardoso 2 qualifies as a majority government.

form such an agenda.²⁸ Whether this pattern will continue in future is, of course, unknown.

But for now the pattern is clear.

Discussion: Cartels and successful governance

Does the fact that Cardoso constructed an agenda cartel and ruled through it, in a fashion analogous to many prime ministers, mean that he was powerful or successful? Any chief executive who fashions a parliamentary agenda cartel must bargain with his partners for every major piece of legislation. Whatever the chief executive's level of control over those internal negotiations—low, medium or high—once a bargain within the cartel has been struck, the implementation of that bargain within the assembly will typically entail enough support from the governing partners to pass the relevant bill.²⁹ Thus, one can no more deduce presidential power in Brazil from the high cohesion of the president's support coalition than one can deduce prime ministerial power in Japan from the high cohesion of the government's troops (cf. Ames 2001). On the other hand, finding that Cardoso created an agenda cartel does mean that he acted, in one important way, like a premier. Moreover, there is no reason to suppose that he was outside the normal range of success of premiers. This is not to disagree with specific examples of how and why Cardoso had trouble with his coalition, such as Samuels' (2003, ch. 9) careful explanation of the high price Cardoso had to pay for the *Plano Real*. It is just to suggest that premiers have also had to pay high prices in their countries for their legislative accomplishments. To make any headway in comparing Cardoso's success to that of another chief executive, one would have to know much more.

²⁸ We continue to ignore Collor 2, which lasted only a few months and generated only two usable roll calls. Suppose one thought that Collor 2 did constitute an agenda cartel (since the only governing party, the PFL, has a zero roll rate). There are a variety of reasons to doubt this judgment but, even if one arrived at it, one would merely have found a case of a minority government that did cartelize the agenda, as frequently occurs in the European cases. This would not conflict with the cartel thesis.

²⁹ For, if sufficient support is *not* lined up, then what was the point of the bargaining to begin with?

Among other things, it would help to know why each chief executive chose to form a majority government, even at the cost of respecting each partner's veto, rather than form a minority government and have more flexibility in forming tailor-made support coalitions for each issue. In the next section, we briefly consider the choice of minority/majority government—first in the abstract, then in the particular case of Brazil.

Discussion: On choosing minority (or majority) government

It is beyond the scope of this paper to provide a general model of the conditions under which minority rather than majority governments emerge in Brazil. We can, however, review two prominent studies of minority government and see how the factors they identify play out in the Brazilian case.

Strom (1990) provides the best-known study of minority governments, focusing on European parliamentary cases. In a nutshell, Strom argues that minority governments emerge when some parties find it electorally costly to join a government, with whose policies they will inevitably be associated, and thus prefer to await the next elections. For such parties, accepting current portfolios threatens to diminish their future share of votes, seats and portfolios; while eschewing current portfolios promises to maintain or even boost their future share of votes, seats and portfolios. The tendency to refuse current government portfolios is even stronger when opposition parties enjoy better procedural rights (such as rights to a proportional share of chairs of the powerful committees in the Scandinavian parliaments).

Cheibub (2002) provides a recent study of minority governments in presidential systems. He finds that more parliamentary parties, bicameralism, and non-concurrent elections all boost the probability of minority government. One way to interpret his empirical findings is as follows. Majority governments must be negotiated. The larger the

effective number of parties, the more separate actors who must be brought into those negotiations in order to form a majority, hence the more likely are those negotiations to break down. Similarly, bicameral systems essentially double the number of players at the table, again complicating negotiations.³⁰ Finally, non-concurrent presidential and legislative elections deprive negotiators of one natural set of tools (mutual endorsements) to build a majority.

One variable that Cheibub does not include but that fits in the same line of argument is the internal cohesion of the parties in a given polity. Morgenstern (2001) has noted that factions and mavericks sometimes play an independent role in Latin American legislatures. Factionalization (or atomization) would again multiply the number of players at the table during negotiations, making the formation of majority governments more difficult.

In sum, Cheibub's work focuses on the sheer number of distinct agents that would need to have a seat at the table during the negotiations to form a majority government and predicts that, the greater this number, the less likely the negotiations are to succeed. If negotiations fail, however, then by definition the result is a minority government. Strom's work, in contrast, focuses on the incentives facing parties and posits that there may sometimes be a trade-off between enjoying current portfolios and enjoying future electoral success.

How do these considerations bear on the Brazilian case? There is not much change in the effective number of parliamentary parties from before Cardoso (7.9) to after (7.2). We have examined the cohesion of the big seven parties over time and do not find much

³⁰ Compare Druckman and Thies (2002), who find that bicameralism significantly decreases the duration of governments in parliamentary systems.

change there, either (from before to after Cardoso).³¹ Neither the nature of Brazil's bicameralism nor the nature of its legislative committees have changed during the period under study. Finally, it is not clear that the Stromian trade-off parties face between accepting office now and winning votes later has cut very differently in the various administrations under consideration.

This leaves one factor that has changed. Brazil changed from a non-concurrent to a concurrent electoral cycle in 1994, at Cardoso's first election. Thus, one might conjecture that Cardoso chose to build a large electoral coalition for both presidential and legislative purposes, then leveraged this into a workable legislative majority. Samuels' (2000) work documenting the importance of gubernatorial politics in structuring the elections of federal deputies suggests some definite limits to this line of thinking. Nonetheless, Samuels reports that presidential coattails, although not as large as gubernatorial, are statistically significant. They might thus provide some glue with which to put together a more stable legislative coalition, more or less along the standard lines of argument.

If aligning the executive and legislative electoral calendars in 1994 helps explain why Cardoso is the only recent Brazilian president to form a majority government, then one would expect his successors to follow suit. At this point, however, it is too early to tell.

Conclusion

In this paper, we have examined what we call parliamentary agenda cartels. A governing coalition of parties (i.e., those holding cabinet portfolios) constitutes a parliamentary agenda cartel when they (1) take a controlling share of agenda-setting offices

³¹ Comparing average Rice indices of cohesion for 1991-95 and 1995-99, one finds two parties *decreasing* their cohesion: the PMDB (13 percentage points) and the PPB (5 points). Two parties exhibited small increases: the PT (3 points) and PDT (5 points). Three parties exhibited somewhat larger increases: the PSDB, PTB and PFL (all 12-14 points). Considering the size of the respective parties, there is not much net change in the cohesiveness of the parties with which a president would have to deal in forming a cartel.

for themselves; and (2) decide the legislative agenda in a fashion that amounts to allowing each partner in the coalition to veto the placement of bills on the plenary agenda. This definition is abstract enough that it applies both to traditional parliamentary regimes and to some presidential regimes (those in which the leaders of legislative parties can accept cabinet portfolios and either continue to sit in the assembly or retain the right to resume their assembly seats when they resign their portfolio). We are interested in how prevalent such parliamentary agenda cartels are in the world's legislatures. In particular, we focus on the cartel thesis: the proposition that, if a majority government forms, then it will constitute a parliamentary agenda cartel.

Operationally, what are “majority governments” and how does one identify “parliamentary agenda cartels?” We define a government as the set of all legislative parties that hold cabinet portfolios. A majority government is then one whose component parties' seat shares—discounted by the quality of their representation in the cabinet—add up to a majority.

To identify parliamentary agenda cartels, we look for three observable patterns. First, the component parties of the putative cartel should each have roll rates that are comparable to those found for governing parties in parliamentary regimes (below 5%). Relatedly, there should be no systematic relationship between parties' ideological locations and their roll rates, within the government. Second, the component parties of the cartel should each have a share of portfolios comparable to their share of seats within the government, as is the case in parliamentary regimes (Browne and Franklin 1973, Budge and Keman 1990, ch. 4, Laver and Schofield 1990, ch. 7, Schofield and Laver 1985). Third, the chief executive should—having lined up his legislative ducks—actually use them to pass statutes and constitutional amendments, rather than relying primarily on decrees.

With definitions of majority government and agenda cartel in hand, we examined the case of Brazil's Chamber of Deputies. We found that only Cardoso's second cabinet was a majority government in the period we study (1989-98), with all other presidential cabinets being minority governments. We also found that only Cardoso formed an agenda cartel, with all three criteria for identifying such cartels telling a consistent story.

If Brazilian presidents always chose to form cartels, then our positions would be similar to that of Figueiredo and Limongi (1999; 2000). These authors contend that *all* Brazilian presidents since 1988 have colluded with party leaders to use their agenda and patronage powers to buy off the support of blocs of deputies. In their words, "Presidents 'form a government' in the same way as prime ministers do in multiparty systems ..." (1999, p. 101).

We agree that all presidents have formed support coalitions. However, the nature of the support coalitions for Brazilian presidents and European Prime Ministers differs substantially as regards the cabinet and legislative agenda. Prime Ministers must constantly maintain majority support in the parliament.³² To this end, they typically appoint a cabinet of legislative party leaders; and they negotiate a legislative agenda with their partners that will be acceptable to all (lest a disgruntled partner defect on a vote of confidence and bring down the coalition). Brazilian presidents, in contrast, have more options. Their continuance in office does not require constantly maintaining a majority in the legislature. Thus, some Presidents—such as Sarney, Collor, and Franco—have chosen to rule more by decree, to appoint more technocratic or crony-based cabinets, and not to negotiate their legislative agenda with a stable majority support coalition. Unlike a typical majority

³² Even minority governments must maintain a majority who tolerate their existence.

parliamentary government, legislative supporters of these presidents had no guaranteed voice in setting the agenda. On the other hand, some Presidents—only Cardoso thus far, according to our figures—have chosen to rule more through statutes, to appoint more partisan cabinets, and to agree on a legislative agenda that all pivotal members of a stable support coalition—or agenda cartel—can live with. Given our findings on how the various parties have voted on agenda-setting votes, we would view only Cardoso as operating in a parliamentary style.

We believe that Brazil's legislative politics are neither consistently "atomistic" (per Ames 2001) nor consistently "parliamentary" (per Figueiredo and Limongi 2000). Instead, the pattern of governance in Brazil depends on an initial strategic choice made by the president, in light of the lay of the political land (per Altman 2001, Amorim Neto 1998, Cox and Morgenstern 2001). In future, more work needs to be done about the determinants of this initial presidential choice. In the present work, we have shown that this choice does carry with it important consequences for the nature of the legislative process.

Table 1: Roll Rates on Project and Agenda-Setting Votes, per Cabinet(s) and Party in Brazil's Chamber of Deputies (1989-1998)

Presidential cabinet(s)	Number of Roll Calls	PT	PDT	PSDB	PMDB	PTB	PFL	PPB
Sarney 3 (01/09-03/90)	18	88.9	77.8	38.9	<u>0</u>	16.7	<u>5.6</u>	11.1
Collor 1 (03/90-10/90)	9	100	100	33.3	<u>22.2</u>	0	<u>0</u>	0
Collor 2 (10/90-01/91)	2	100	100	50	0	0	<u>0</u>	0
Collor 3+4 (02/91-10/92)	38	73.7	52.6	36.8	5.3	10.5	<u>15.8</u>	23.7
Franco 1-5 (10/92-12/94)	25	72.0	52.0	<u>8.0</u>	<u>4.0</u>	16.0	<u>16.0</u>	20.0
Cardoso 1+2 (01/95-12/98)	161	88.2	79.5	<u>1.8</u>	<u>3.1</u>	<u>4.3</u>	<u>1.8</u>	6.2

Note: Collor was removed from office on corruption charges in October 1992, having been replaced by his vice mate Franco. The president's term was reduced from 5 to 4 years in 1994. That is why Sarney served for 5 years, while Cardoso served for 4 in his first term. Cardoso was elected for a second four-year term in October 1998.
